COVER LETTER

Dear Hiring Manager,

I am studying Data and Network Engineering at University West and am looking for an internship or junior software-development role. My coursework and projects span software development, backend systems, networking, applied machine learning and embedded systems. I now want to use that experience in a professional team and continue learning from experienced developers.

In the Aurora Grand Hotels team project, I contributed to a hotel booking system built with FastAPI, MySQL and JavaScript. My work included API integration, authentication, the booking flow and backend price calculations. The project gave me practical experience of connecting a frontend, an API and a database into one working system.

I have also combined networking and machine learning in a project that classified VPN and NonVPN traffic using Python and scikit-learn. I worked with data cleaning, model comparison and evaluation. In ns-3, I configured C++ simulations to compare TCP Cubic and NewReno and visualized the results with GNUplot.

I can contribute a broad technical perspective, experience reading and debugging code, and an interest in understanding how the whole system works. I am still a student with more to learn, but I take responsibility for my work, ask questions when something is unclear and enjoy solving concrete problems with others.

I would be happy to discuss my projects and how I could contribute to your team. Thank you for considering my application.

Sincerely,
Shucayb Ahmed
